Telekom kompaniyasidagi mijozlar ketishini tahlil qilish va bashorat qilish.

1.Biznes muammosini tushunish

Telekom kompaniyalari uchun mijoz ketishini (churn) bashorat qilish moliyaviy va strategik ahamiyatga ega. Yangi mijoz jalb qilish saqlab qolishdan 5-10 baravar qimmat, ketish esa doimiy daromadni yoʻqotadi. Bashoratli tahlil muammolarni erta aniqlab, chegirma yoki xizmat yaxshilash kabi choralar koʻrishga yordam beradi. Segmentatsiya xavfli mijozlarga shaxsiy takliflar yoʻnaltirish imkonini beradi, bu sadoqatni oshiradi.Xavfli mijozlar qatoriga tenure qisqa (<6 oy) yangi mijozlar, month-to-month shartnomalilar, yuqori toʻlovchilar, fiber optic internet foydalanuvchilari va texnik muammolarga duch kelganlar kiradi. Bularning ketish ehtimoli yuqori boʻlib, ularga alohida e'tibor talab qilinadi.

2. Ma'lumotlarni tahlil qilish va gipotezalarni tekshirish:

	customerID	gender	SeniorCitizen	Partner	Dependents	tenure	PhoneService	MultipleLines	InternetService	OnlineSecurity	
0	7590- VHVEG	Female	0	Yes	No	1	No	No phone service	DSL	No	
1	5575- GNVDE	Male	0	No	No	34	Yes	No	DSL	Yes	
2	3668- QPYBK	Male	0	No	No	2	Yes	No	DSL	Yes	
3	7795- CFOC W	Male	0	No	No	45	No	No phone service	DSL	Yes	
4	9237- HQITU	Female	0	No	No	2	Yes	No	Fiber optic	No	

Endi bizga berilgan ma'lumotning shakli va o'lchamini kurib chiqamiz:

```
1 df.shape # Ma'lumotlar to'plamining o'lchamini ko'rsatish
(7043, 21)
```

End bizga berilgan ma'lumotlar asosida ma'lumotlarni tahlilini ya'ni gipotezalarni ko'rib chiqamiz:

1. Yangi mijozlar koʻproq ketadimi?

```
1 import matplotlib.pyplot as plt
   2 from scipy.stats import ttest ind, chi2 contingency
   3 # Gipoteza 1: Yangi mijozlar koʻproq ketadimi?
   4 tenure churn = df[df['Churn'] == 'Yes']['tenure']
   5 tenure no churn = df[df['Churn'] == 'No']['tenure']
     print("\nGipoteza 1: Yangi mijozlar koʻproq ketadimi?")
   8 print(f"Ketganlar o'rtacha tenure: {tenure churn.mean():.2f}")
      print(f"Qolganlar o'rtacha tenure: {tenure no churn.mean():.2f}")
  11 t stat, p val = ttest ind(tenure churn, tenure no churn, equal var=False)
  12 print(f"T-test natijasi: t-statistic = {t_stat:.3f}, p-value = {p_val:.3f}")
  13 if p val < 0.05:
          print("Natija: Gipoteza tasdiqlandi (farq statistik jihatdan muhim).")
  15 else:
          print("Natija: Gipoteza rad qilindi (farq statistik jihatdan muhim emas).")
Gipoteza 1: Yangi mijozlar koʻproq ketadimi?
Ketganlar o'rtacha tenure: 17.98
Qolganlar o'rtacha tenure: 37.57
T-test natijasi: t-statistic = -34.824, p-value = 0.000
Natija: Gipoteza tasdiqlandi (farq statistik jihatdan muhim).
```

2. Internet xizmatidan foydalanuvchilar koʻproq ketadimi?

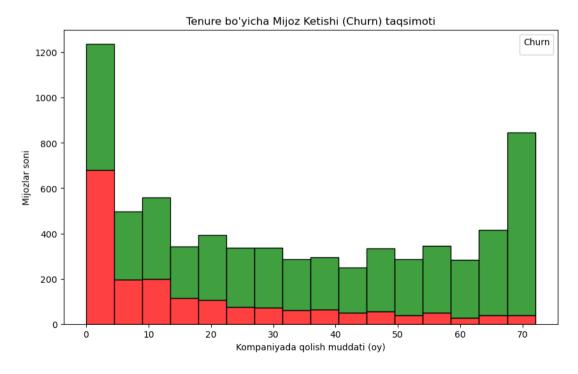

3. Ayollar kamroq ketadimi?

```
# Gipoteza 3: Ayollar kamroq ketadimi?
      print("\nGipoteza 3: Ayollar kamroq ketadimi?")
      contingency gender = pd.crosstab(df['gender'], df['Churn'])
      print("Kontingens jadvali:")
      print(contingency gender)
      chi2_gender, p_gender, dof_gender, expected_gender = chi2_contingency(contingency_gender)
      print(f"Chi-square test natijasi: chi2 = {chi2 gender:.3f}, p-value = {p gender:.3f}")
      if p gender < 0.05:
          print("Natija: Gipoteza tasdiqlandi (jins va churn o'rtasida farq bor).")
      else:
          print("Natija: Gipoteza rad qilindi (jins va churn o'rtasida farq yo'q).")
Gipoteza 3: Ayollar kamroq ketadimi?
Kontingens jadvali:
Churn
         No Yes
gender
Female 2549 939
        2625 930
Chi-square test natijasi: chi2 = 0.484, p-value = 0.487
Natija: Gipoteza rad qilindi (jins va churn o'rtasida farq yo'q).
```

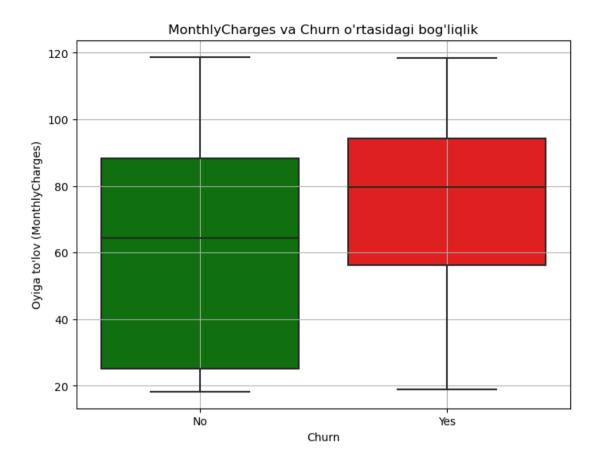

Bu natijalarni olganmizdan kiyingi bosqichga o'tamiz.

3. Vizualizatsiya:

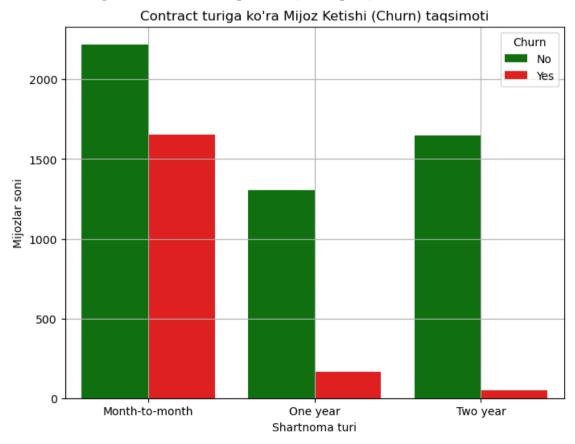

1. Tenure (kompaniyada qolish muddati) boʻyicha Churn taqsimoti boʻyicha grafik.

2. MonthlyCharges va Churn oʻrtasidagi bogʻliqlik (boxplot)

2. Contract turiga koʻra Churn taqsimoti (countplot)

Kiyingi qadamga o'tamiz:

4. Ma'lumotlarni tozalash:

1. Yetishmayotgan qiymatlar (NaN)

```
1 # NaN qiymatlar sonini ko'rish
2 print("NaN qiymatlar soni:\n", df.isna().sum())
3
4 # NaN qiymatlar bor satrlarni olib tashlash
5 df_clean = df.dropna()
```

NaN qiymatlarni quyidagi berilgan kod orqali topib oldim va ularni tashlab yubordim.

2. Har bir ustun bo'yicha '??' yoki 'unknown' qiymatlar borligini tekshirish

Buni ham quyidagi berilgan kod orqali bajarib chiqdim.

3. Noodatiy yoki salbiy qiymatlar (TotalCharges > 10000, tenure < 0)

Bu bosqichda NaN qiymatlarni va keraksiz ustunlarni uchrib yuqotib oldim va kiyingi bosqichga utdim ya'ni bu bosqich xususiyatlar bilan ishlash bosqich deb atalar ekan.

5. Xususiyatlar bilan ishlash:

1. Kategorik ustunlarni kodlash (One-Hot yoki Label Encoding)

```
# Kategorik ustunlar (object yoki bool)
categorical_cols = df_clean.select_dtypes(include=['object', 'bool']).columns.tolist()
print("Kategorik ustunlar:", categorical_cols)
```

Birinchi bulib kategorik ustunlarni topib oldim va kiyin,

```
from sklearn.preprocessing import LabelEncoder

le = LabelEncoder()
df_encoded = df_clean.copy()

# faqat ikkilik ustunlarga label encoding qo'llash
for col in categorical_cols:
    if df_encoded[col].nunique() == 2:
        | df_encoded[col] = le.fit_transform(df_encoded[col])

df_encoded = pd.get_dummies(df_encoded, columns=[col for col in categorical_cols if df_clean[col].nunique() > 2], drop_first=True)
```

Ularni LabelEncoder yordamida kodlab oldim.

2. Sonli ustunlarni masshtablash (Scaler orqali)

```
from sklearn.preprocessing import StandardScaler

# Sonli ustunlar (int yoki float)
numeric_cols = df_encoded.select_dtypes(include=['int64', 'float64']).columns.tolist()

# Xohlasangiz, 'Churn' ustunini olib tashlang (agar u target bo'lsa)
if 'Churn' in numeric_cols:
numeric_cols.remove('Churn')

# Masshtablash
scaler = StandardScaler()
df_encoded[numeric_cols] = scaler.fit_transform(df_encoded[numeric_cols])

13
```

6. Model yaratish:

Model yaratishda RandomForest va Logistic Regrision modellarini tanlab oldim va ulardan kelib chiqib uzimga kerakli bulgan modelni ya'ni yuqori natija berganini model sifatida saqlab oldim.

```
from sklearn.linear_model import LogisticRegression
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import accuracy_score, f1_score, roc_auc_score
```

Bu yerda ikkala model uchun kerakli bulgan kutubxonalarni importini ko'rishimiz mumkin.

```
5 # 1. Logistic Regression
6 log_model = LogisticRegression(max_iter=1000)
7 log model.fit(X train, y train)
8 log preds = log model.predict(X test)
9 log proba = log model.predict proba(X test)[:,1]
11 # 2. Random Forest
12 rf model = RandomForestClassifier(n_estimators=100, random_state=42)
13 rf_model.fit(X_train, y_train)
14 rf preds = rf model.predict(X test)
15 rf_proba = rf_model.predict_proba(X test)[:,1]
18 log_scores = {
        'accuracy': accuracy_score(y test, log_preds),
        'f1': f1_score(y_test, log_preds),
        'roc auc': roc auc score(y test, log proba)
24 rf scores = {
       'accuracy': accuracy_score(y_test, rf_preds),
        'f1': f1_score(y_test, rf_preds),
        'roc_auc': roc_auc_score(y_test, rf_proba)
```

```
1  # Natijalarni chiroyli ko'rsatish
2  print("Model baholash natijalari:\n")
3
4  print("Logistic Regression:")
5  for metric, score in log_scores.items():
6  | print(f" {metric.capitalize()}: {score:.4f}")
7
7
8  print("\nRandom Forest:")
9  for metric, score in rf_scores.items():
10  | print(f" {metric.capitalize()}: {score:.4f}")
11
12  # Eng yaxshi modelni aniqlash (F1 asosida, istasangiz ROC-AUC asosida ham tanlashingiz mumkin)
13  best_by = 'f1' # yoki 'roc_auc' yoki 'accuracy'
14
15  if rf_scores[best_by] > log_scores[best_by]:
16  | best_model = rf_model
17  | best_model_name = "Random Forest"
18  else:
19  | best_model = log_model
10  | best_model_name = "Logistic Regression"
11
22  print(f"\n  Eng yaxshi model: {best_model_name} ( {best_by.upper()} = {max(rf_scores[best_by], log_scores[best_by]):.4f} )")
13
```

```
Model baholash natijalari:

Logistic Regression:
    Accuracy: 0.7958
    F1: 0.5639
    Roc_auc: 0.8451

Random Forest:
    Accuracy: 0.7940
    F1: 0.5105
    Roc_auc: 0.8467

✓ Eng yaxshi model: Logistic Regression ( F1 = 0.5639 )
```

Tepadagi rasmlardan kurishingiz mumkin bu yerda eng yaxshi model bu Logistic Regression va ushani uchun shu modelni saqlab olaman.

```
import joblib

import joblib

# Eng yuqori F1 score asosida model tanlash (yoki roc_auc/accuracy asosida tanlashingiz mumkin)

if rf_scores['f1'] > log_scores['f1']:

best_model = rf_model

print("Random Forest eng yaxshi model sifatida tanlandi.")

else:

best_model = log_model

print("Logistic Regression eng yaxshi model sifatida tanlandi.")

# Modelni saqlash

import os

sos.makedirs("models", exist_ok=True)

model_path = "models/best_churn_model.pkl"

joblib.dump(best_model, model_path)

print(f"Model saqlandi: {model_path}")

Logistic Regression eng yaxshi model sifatida tanlandi.

Model saqlandi: models/best_churn_model.pkl
```

7. Natijalarni tahlil qilish

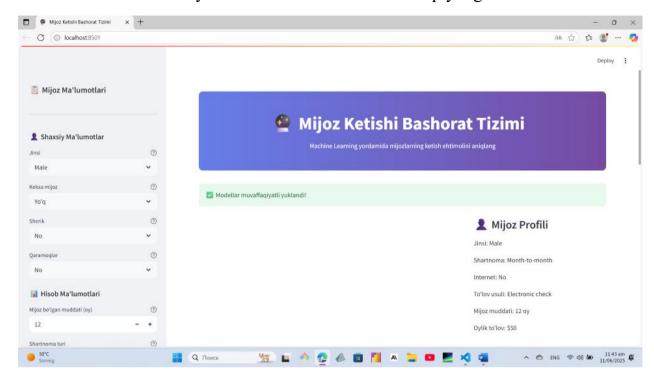

```
1 import pandas as pd
    feature_importances = pd.Series(rf_model.feature_importances_, index=X train.columns)
      feature_importances = feature_importances.sort_values(ascending=False)
    5 print(feature_importances.head(10))
tenure
                                   0.082426
                                0.078735

```

8. Oddiy tizim yaratish:

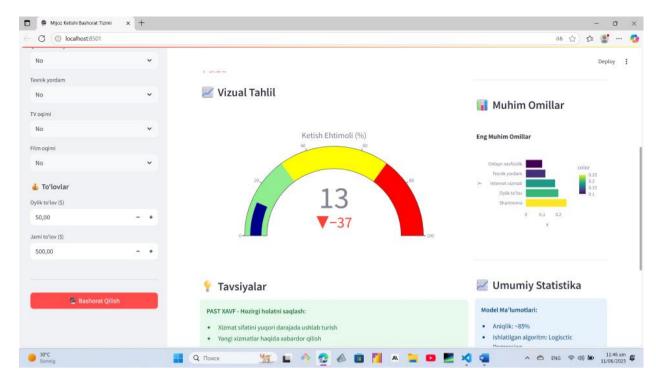

Birinchi bulib web-site yaratdim web-siteni ko'rinishi quydagicha:

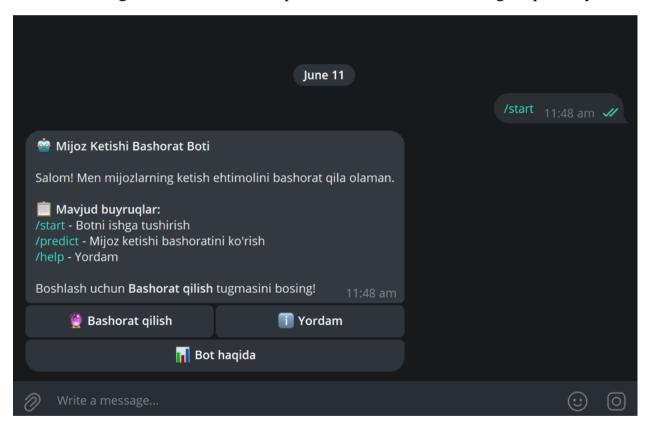

Agar bashorat qiladigan bulsak quyidagi ko'rinishni beradi.

Bunda visual tahlil funksiyasi ham bor unda mijozning qolishi ketishi ehtimoligi kursatilgan.

2. Alohida telegram uchun ham bot qildim botda ham web-sitedagidaqa ishlaydi

Endi botni ishlashini kuramiz:
